the Aid of a Computer

deficiency  $\delta$ , the authors proceeded from the equation for the diffusion of specific humidity, and derived equation (6) which was first obtained

by M. Ye. Shvets: 
$$\frac{d_h \delta}{dt} = \left[ \frac{\kappa - 1}{\kappa} T - \frac{(b + t_d)^2}{ab M} \right] \frac{T}{p} - \tau \frac{\partial \delta}{\partial p}$$

A statistical investigation was carried out to estimate the summands in the right-hand part of this equation. On the basis of this investigation, the final formula was obtained for calculating  $\delta$  on the 850, 700, and

500 mb levels: 
$$(\frac{\partial \delta}{\partial t})_k = A (\delta, z)_k + \frac{\alpha_k}{p} \tau$$

$t_d$  is the dew point,  $z$  the altitude of the isobaric surface,  $(\delta, z)$  the finite-difference expression of the Jacobian with a "differentiation step" of 600 km. The predetermination of  $\delta$  is the component and final part of the forecast of pressure fields and vertical currents. The vertical currents are determined on the levels mentioned according to the

pressure field calculated and the geopotential tendencies during each  $\Delta t$ . The resulting forecast of the meteorological elements mentioned is made on the ETsVM [electronic digital computer] M-20 (M-20) within 30 minutes. Nine daily forecasts of the dew-point deficiency on the 850, 700, and 500 mb levels during the cold half-year have been calculated up to date. Figs. 1 and 2 show examples of such forecasts. The authors describe the plotting of nomograms on 850 and 700 mb levels for cloudiness and precipitation forecasts (Fig.3). An analysis of forecasts of all weather processes showed a probability of 80%. There are 3 figures, 2 tables, and 6 references: 4 Soviet.

AUTHORS: Dushkin, P.K., and Lomonosov, Ye.G.

TITLE: Results of forecasts of the baric field at three levels by means of a calculating machine

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 11, 196 , 40,  
abstract 11B280 (Tr. Tsentr. in-ta prognozov, no. 106,  
1960, 20 - 31)

TEXT: A numerical scheme developed by the authors for forecasting the baric field at three levels (300, 500, and 850 mb.) is described. It is based on the known solution of the baroclinic problem of forecasting given by N.I. Buleyev, and G.I. Marchuk. The main factors permitting the derivation of a stable numerical solution to the problem are discussed (the due selection of differentiation spaces, the presentation of derivatives as final differences, the approximation of integrals as final sums, etc.). The results of fifteen trial forecasts computed on the "Strela" machine are cited. The analysis of these forecasts testifies to the definitely practi

Card 1/2

Results of forecasts of the ...

S/169/61/000/011/043, 063  
D228/D304

cal value of the scheme under consideration. Thus, in a number of cases this scheme enables the intense reconstruction of the baric field to be successfully precalculated. A forecast according to the barotropic scheme was also given for several cases. The baroclinic scheme gave substantially better results in all cases. The main defects of the forecasts are the errors related to the use of fictitious boundary conditions at the edges of the region. The results of the solution of the prognostic problem for the atmosphere derived by Ye.G. Lemonosov and considered as a medium which consists of two layers (the troposphere and stratosphere) differing in the magnitude of the parameter of static stability are also discussed in the work. The main differences between this solution and the one with the constant stability parameter are elucidated. The solution for the two layer medium (in comparison with the one layer solution) indicates the wider horizontal spreading of the influence of eddy advection in the stratosphere. This circumstance is connected with the fact that the stratosphere is characterized by more stable stratification. [Abstracter's note: Complete translation]

AUTHOR: Lomonosov, Ye.G.

TITLE: On applying the influence functions in hydrodynamic forecasting of the baric field

PERIODICAL: Referativnyy zhurnal, Geofizika, no.3, 1962, 53,  
abstract 8B358 (In collection: "Materialy Soveshchaniya Koordinats. komis. po chisl. metodam prognoza". L., Gidrometeoizdat, 1961, 44-52)

TEXT: In comparing the calculation schedule on the basis of the known solution of N. I. Buleyev and G. I. Marchuk relative to the tendency of the height of the isobaric surface  $\partial z / \partial t$  for quasi-geostrophic and quasi-static models of the atmosphere, the integrals are substituted by finite sums. Thereby, integration along an infinite plane, for which the Earth is taken as a simplification, is substituted by integration along a limited area. The dimensions of this area are usually determined as a rough approximation, taking into consideration the behaviour of the influence function. To avoid errors which arise in the case of such a "cutting-off" of the solution, it is proposed to solve

Card 1/3

On applying the influence functions ... S/169/62/000/008/049/090  
E073/E535

the problem of determining  $\partial z/\partial t$  in a somewhat different formulation. The initial equation for determining  $\partial z/\partial t$  is integrated according to  $\varphi$  from 0 to  $2\pi$  and is written in a cylindrical system of coordinates  $r, \varphi, \xi$ , where  $\xi = p/p_0$  - the reduced pressure ( $p_0 = 1000$  mb). In an appropriate manner the boundary conditions are also changed. The solution obtained for such a formulation of the problem with subsequent application of the integral transform of Hankel is applied for comparing the numerical scheme of forecasting the partial field, whereby  $\partial z/\partial t$  is determined by means of successive approximations. Application of the second approximation improves the quality of diurnal forecasts of the pressure field. The given statistical characteristics of the degree of justification of the series of operative forecasts carried out according to the scheme in the second approximation, constructed on the basis of the solutions of N. I. Buleyev and G. I. Marchuk and compared by the synoptic method in TsIP also indicates a qualitative improvement of the preliminary calculations according to the here presented scheme. Obviously, the quality

Card 2/3

On applying the influence functions ... S/169/62/000/008/C49/390  
E073/E535

of forecasting will be better still if the number of approximations is increased.

TITLE: Ordered vertical movements of the air and of cloudiness

SOURCE: Meteorologiya i hidrologiya, no. 3, 1964, 10-16

TOPIC TAGS: air, cloud, vertical movement, ordered vertical movement, cloudiness, geostrophic approximation, advection, isobaric surface

ABSTRACT: The authors have computed vertical movement of the air on the basis of an equation for heat influx in adiabatic and geostrophic approximation. The vertical velocity is determined by geostrophic advection of temperature and by local variation in this value. The velocity may be represented as a function of the height of isobaric surfaces and as a function of the instantaneous changes in this pressure field with time. The authors have computed velocities from a number of data and have compared these values with actual states of cloudiness. They conclude that information on vertical velocities furnishes little of diagnostic value in predicting cloudiness. But, in the examples studied, where well-

Card 1/2

ACCESSION NR: AP4022210

defined descending movements of air were observed, cloudiness was generally absent. Information on clouds (form, extent), however, may reliably determine the nature of vertical movements when conditions are favorable. Orig. art. has: 3 figures and 1 formula.

TITLE: On clarification of the solution of the problem of 24-hour prognosis of a baric field in a barocline atmosphere

CITED SOURCE: Tr. Vses. nauchn. meteorol. soveshchaniya. T. 2. L., Gidrometeoizdat, 1963, 21-26

TOPIC TAGS: meteorology, dynamic meteorology, weather prognosis, hydrodynamic prognosis, weather forecasting

TRANSLATION: A comparison is made of the quality of hydrodynamic short-term prognosis of weather with the use of schemes based on:

- 1) the Buleyev-Marchuk integral formula, which is the solution of a suitable elliptical equation with an infinite zone along the horizontal,
- 2) the solution of this same equation in a limited zone, which is the sum of integrals along this zone (cylinder) which limit its surface.  
Card 1/3

ACCESSION NR: AR4034738

The solution according to the second scheme requires sequential approximations. In the capacity of the first, a solution without a surface integral is accepted. According to the authors, this approximate formula already gives a solution which is equal in accuracy to the results of the formula of the first scheme, since in calculations according to the first scheme, the function of influence has to be "trimmed." The solution found is used for the second approximation during the calculation of the integral omitted at first, etc. From a practical standpoint, the second and third approximations coincide. This gave the basis for a limitation to two approximations in the calculations. The results of the calculations according to a three-level scheme demonstrated the superiority of the second scheme.

A four-level prognostical scheme was worked out, including the sea level and three levels of the preceding scheme. It is noted, that the quality of the prognosis on the latter did not improve; at the same time, changes in the sea level are determined basically by the physical factors of the layers above it, since the results practically do not depend on whether the subintegral functions (advection of wind and temperature) on the sea level are calculated.

A significant improvement in the prognosis on the lower levels was obtained by means of calculating friction, for which, the vertical speed was taken as

Card 2/3

ACCESSION NR: AR4034738

non-disappearing along the sea level, and proportional to the Laplace operator along the geopotential of this level. The coefficient of the turbulent viscosity was found best selected in the 20-80 sq meters/sec range.

Ed.: Striganov, A.R., Doctor of Physical and Mathematical Sciences; Ed. of Publishing House: Berlin, Ye.N.; Tech. Ed.: Karasev, A.I.

PURPOSE: This book is intended as a textbook for metallurgical institutes, and may also be used to advantage by technicians working in spectroscopy laboratories.

COVERAGE: The author explains the theoretical aspects of spectral analysis. He describes the spectroscopic equipment used in this field, the techniques of using such equipment, and also brings out the important role played by spectral analysis in industry, especially in ferrous and nonferrous metallurgy. In Chapter VI the author lists several errors of measurement, random and systematic, of quantitative analysis. Recognition is given by the author to A.R. Striganov, V.G. Koritskom, S.M. Rayskom, I.M. PURPOSE: This book is intended for scientists and researchers in the field of spectroscopy, as well as for technical personnel using spectrum analysis in various industries.

CONTENTS: This volume contains 177 scientific and technical studies of atomic spectroscopy presented at the 10th All-Union Conference on Spectroscopy in 1956. The studies were carried out by members of scientific and technical institutes and include extensive bibliographies of Soviet and other sources. The studies cover many phases of spectroscopy: spectra of rare earths, electromagnetic radiation, physicochemical methods for controlling uranium production, physics and technology of gas discharges, optics and spectroscopy, abnormal dispersion in metal vapors, spectroscopy and the combustion theory, spectrum analysis of ores and minerals, photographic methods for quantitative spectrum analysis of metals and alloys, spectral determination of the hydrogen content of metals by means of isotopes, tables and atlases of spectral lines, spark spectrographical analysis, statistical study of variation in the parameters of calibration curves, determination of traces of metals, spectrum analysis in metallurgy, thermochromistry in metallurgy, and principles and practice of spectrochemical analysis.

AUTHOR: Ivanova, M.K., Lomonosova, T.N. and Yakovleva, A.V.  
TITLE: Action of Ultraviolet Radiation on Metallic Mirrors  
(Deystviye ul'trafioletovogo izlucheniya na metallicheskije  
zerkala)  
PERIODICAL: Optika i Spektroskopiya, 1958, Vol IV, Nr 4,  
pp 535-536 (USSR).

ABSTRACT: The authors measured the reflectivity of aluminium and rhodium mirrors in the Schumann region of the spectrum under the action of ultraviolet light in vacuum. The source of light was a hydrogen lamp GOI, which was placed opposite the slit of a vacuum fluorite spectrograph at an angle of 57° to the sample. The error in measurement was about 5%. Reflectivity of aluminium mirrors was found to depend strongly on the method of evaporation. Stringent precautions were necessary to ensure purity of the materials used and cleanliness of the base. The evaporation was produced using high currents through tungsten spirals. Figure 1 shows the reflectivity curves for aluminium mirrors obtained by various authors; Curves 1, 2, 4 and 5 correspond to Refs 7, 6, 8 and 4, respectively. Curve 3 in Figure 1 represents the present authors' results. Irradiation with ultraviolet in the Schumann region (beginning from 1700 Å)

Action of Ultraviolet Radiation on Metallic Mirrors

reduces reflectivity of aluminium and rhodium mirrors. The latter were obtained by electrolytic deposition and were stable under the action of atmospheric air. In Figure 2, Curve 1 gives the reflectivity of aluminium measured immediately after deposition; Curve 2 shows reflectivity after 8 hours of ultraviolet irradiation and Curve 3 after 15-25 hours of irradiation. Decrease of reflectivity of aluminium mirrors was found to reach a certain limit and further ultraviolet irradiation did not affect it. In Figure 2, Curve 4a (black circles) and Curve 5 represent rhodium mirrors, freshly prepared and after 8 hours of ultraviolet irradiation, respectively. Again, a fall of reflectivity was observed. Decrease of reflectivity is due to oxidation by residual oxygen in the apparatus where all measurements were made. This is confirmed by the reverse effects on reduction of mirrors by irradiation of them in an atmosphere of hydrogen. Figure 2, Curve 6, shows the reflectivity of aluminium, which was decreased by previous irradiation, after irradiation for 15 hours in an atmosphere of hydrogen. Figure 2, Curve 7, shows the effect of the same treatment for rhodium mirrors. Rhodium mirrors can be also reduced by treatment with nitric

Card2/3

Sov/51-4-4-20/24

Action of Ultraviolet Radiation on Metallic Mirrors

acid, as shown by Curve 4b (half-black circles). All these curves show that a considerable improvement or even a complete recovery of reflectivity is obtained by irradiation in a reducing atmosphere. Ultraviolet radiation affects also lithium fluoride and calcium fluoride crystals, both natural and synthetic. In this case, crystals lose some of their transparency. Again, ultraviolet irradiation in an atmosphere of hydrogen does not have harmful effects, as shown by the very long service (3 - 5 years) of hydrogen lamps with fluorite windows. There are 2 figures and 8 references, 4 of which are in English, 3 Soviet and 1 German.

TITLE:

Relation of Structure and Relief to Seismic Activity  
(O svyazi seismichnosti so strukturami i rel'yefom)

PERIODICAL:

Izv. AN KazSSR, ser. geol., 1956, Nr 24, pp 102-107

ABSTRACT:

The author notes that there is no unanimity of opinion on the question of a relation of earthquakes and tectonic structure. He points out that areas of sharp and contrasting relief are more prone to earthquakes; for this reason geomorphology is very important in seismological investigations. The connection between shallow-focus earthquakes and recent tectonic movements and structures (neotectonics) expressed in the relief may be considered proven. Deep-seated earthquakes are connected with depth.

TITLE: Dismountable tank for hydro-explosive forming. Class 7, No. 173696  
Announced by Organization of the State Committee on Shipbuilding, SSSR  
(Organizatsiya gosudarstvennogo komiteta po sudostroyeniyu SSSR)

SOURCE: Byulleten' izobreteni i tovarnykh znakov, no. 16, 1965, 18

TOPIC TAGS: explosive forming, hydro explosive forming, explosion tank, metal-  
working 44 55

ABSTRACT: This Author Certificate presents a dismountable tank for hydro-explosive forming, consisting of stacked circular sections which are sealed along the perimeter and reinforced by external ribs (see Fig. 1). To increase life and flexibility of use, the sections can be disassembled vertically into two or more parts which have vertical ribs along the separation lines and which can be assembled by using clamps. To decrease the tank expansion during the blast, a second feature provides holes in the vertical ribs through which cables can be passed.

Forces (Issledovaniye termodinamicheskikh svoystv dvoynykh  
metallicheskikh sistem metodom elektrodvizhushchikh sil).  
5.The System Copper - Bismuth (5. Sistema med' - vismut)  
PERIODICAL: Zhurnal fizicheskoy khimii, 1959, Vol 33, Nr 5,  
pp 1134 - 1139 (USSR)  
ABSTRACT: The concentration chains  $Cu_{solid} | CuCl, NaCl - KCl |$   
 $(Cu_{N}Bi_{1-N})^+$  liquid (N = molar copper content of the melt)  
were investigated. The investigation was carried out in a  
temperature interval of from 1150 - 1225°K at a concentration  
 $N_{Cu} = 0.063 - 0.710$ . The values for the emf were plotted  
as f(T) for each concentration, and a linear dependence was  
found. The values for 1150, 1175, 1200, and 1225°K were found  
by interpolation. Table 1 shows these values. The activity  
of copper with regard to solid and to liquid undercooled

Card 1/3

The Investigation of the Thermodynamic Properties                    SOV/76-33-5-27/33  
of Binary Metallic Systems According to the Method of Electromotoric  
Forces. 5. The System Copper - Bismuth

copper was calculated from the values for the emf. The values for the logarithm of the activity coefficient of copper ( $\lg \gamma_{Cu}$ ), the partial heats, and the surplus entropies of the mixing of copper are also shown in table 1. Table 2 shows the corresponding values for bismuth. The values for electrodes with a copper content  $N > 0.701$  were found by extrapolation. Figures 1 and 2 show graphical description of the partial and integral heats and the mixing entropies. The system Cu-Bi differs considerably from Raoult's law. The differences decrease with rising temperature. The Cu-Bi melts are formed under heat absorption, the mixing heats being considerably high. With equiaatomic composition their maximum is 1600 kcal/g-atm. The considerable positive differences of the entropy from the ideal values are characteristic of Cu - Bi melts. This fact is explained by the great difference of the atomic volumina of the two components. The retarded change of the mixing heat and the mixing entropies in the range of from 0.3 - 0.7  $N_{Cu}$  is indicated. Hence

Card 2/3

The Investigation of the Thermodynamic Properties  
of Binary Metallic Systems According to the Method of Electromotoric  
Forces. 5. The System Copper - Bismuth SOV/76-33-5-27/33

it is concluded that the Cu - Bi melts have a microheterogeneous structure. There are 3 figures, 2 tables, and 12 references, 6 of which are Soviet.

TITLE: Thermodynamics of reduction reactions of titanium oxides.  
Reduction of titanium dioxide with hydrogen

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 18, 1962, 42, abstract  
18B272 (Sb. nauchn. tr. Inst. tsvetn. met. im. M. I.  
Kalinina, v. 33, 1960, 8 - 12)

TEXT: The reduction reactions of  $TiO_2$  with hydrogen and carbon were analysed thermodynamically on the basis of published data, resulting from which the following equations are recommended: for  
 $2TiO_2 + H_2 \rightarrow Ti_2O_3 + H_2O$ ,  $\Delta H_T = 4095 + 0.874T + 3.856 \cdot 10^{-3}T^2$ ,  
 $\Delta Z_T = 4095 - 2.0125T \log T - 3.856 \cdot 10^{-3}T^2 - 10.1T$ ; for  $TiO_2 + 3C \rightleftharpoons TiC + 2CO$ ,  
 $\Delta H_T = 109400 - 4T$ ,  $\Delta Z_T = 109400 + 9.2 T \log T - 110.86T$ . The mechanism of  $TiO_2$  reduction with hydrogen and carbon is discussed. [Abstracter's Card 1/2]

Investigation of the Pressure and Density  
of Vapor in Systems Containing Organosilicon  
Compounds. II. The Systems: Methylchlorosilane -  
Methyltrichlorosilane - Methyl-  
phenyldichlorosilane, and Methylphenyldichloro-  
silane - Methylchlorophenyldichlorosilane -  
Methyldichlorophenyldichlorosilane

as well as the values of the evaporation heats and evaporation entropies  
for the individual components (Table 1), and the two- and three-component  
solutions at normal boiling temperature were calculated (Table 2). The  
values obtained show that the vapors of methyltrichlorosilane and methyl-  
chlorophenyldichlorosilanes contain associated molecules, whereas the vapors  
of methyldichlorophenyldichlorosilane do not associate. At 100°C and about  
900 torr, the vapor (in equilibrium) over a solution of 50 mole%  
 $\text{CH}_3\text{SiHCl}_2 + 50 \text{ mole\% } \text{CH}_3\text{SiCl}_3$  consists nearly entirely of methyl-  
dichlorosilane. At temperatures from 40° to 100°C, the vapor composition  
of the three-component solutions  $\text{CH}_3\text{SiHCl}_2 - \text{CH}_3\text{SiCl}_3 - \text{CH}_3\text{C}_6\text{H}_5\text{SiCl}_2$   
is slightly different from that of the binary system  $\text{CH}_3\text{SiHCl}_2 - \text{CH}_3\text{SiCl}_3$   
at the same molar ratio of the latter components. Calculations carried

out on the basis of the Antoine equation show that above 100°C no change in the  $\text{CH}_3\text{C}_6\text{H}_5\text{SiCl}_2$  content in the vapor phase takes place, i.e., the content remains low with the exception of solutions in which the molar ratio of  $\text{CH}_3\text{C}_6\text{H}_5\text{SiCl}_2$  is near unity. There are 2 figures, 2 tables, and 2 references: 1 Soviet and 1 US. ✓

of concentration and for temperatures of from 0° to 150°C. The same method of measurement was used as in a previous paper (Ref. 1), and pressure and density of the individual components were determined. The curves obtained on the temperature dependence of pressure and density show that pressure and density of the systems investigated rise exponentially with temperature. Table 1 gives the values of the refractive indices, the density, the boiling points of the components at 760 mm Hg, the molecular weight of vapor at this pressure, the values of the constants of the Antoine equation as well as the values of the evaporation heat and evaporation entropy at the normal boiling point.
